Guidelines For Estimating

Shortkeep Feeder Costs

For Weight Range of 850 - 1400 lbs

Based on feeding 500 steers & selling in fall

Date: **March, 2006**

Cattle feeding is a high risk business requiring large amounts of short term capital to buy feeder cattle and feed. With cyclical price variations for both livestock and feed, successful management involves careful consideration of costs, projection of markets and sound judgement.

The following budget is an estimate of the costs of production encountered in finishing beef cattle in a farm feedlot situation. The purpose of this budget is to assist Manitoba livestock producers to calculate their own cost of production and take into consideration the factors that should be included when budgeting to determine breakeven prices.

The assumptions on which costs are calculated are clearly defined in the supporting pages. When interpreting these costs for an individual situation, adjustments may be required. Note that on farm feed costs are based on market prices at the farm. It is assumed that all feed is grown on the farm, except for supplements. Each assumption must be examined and adjustments made where necessary, to apply to the producer's own situation.

Disclaimer: This budget is only a guide and is not intended as an in depth study of the cost of production of the Manitoba cattle industry. Interpretation and utilization of this information is the responsibility of the user. If you require assistance with developing your individual budget, please contact your local MAFRI Business Development Specialist or Livestock Farm Production Extension Specialist.

Assumptions

1. Average daily gain (ADG) was assumed to be 3.5 lbs/day
2. It was assumed that the feeder steer weighed in at 850 lbs. shrunk weight, finish weight was estimated at 1400 lbs (1330 after 5 % shrink).
3. Days on feed:157days.
4. Investment in feedlot facilities and equipment was assumed to handle 500 head at a time or with 2 turns 1000 head over the year.
